

Name: Solutions

Rules:

You have 90 minutes to complete the exam.

Partial credit will be awarded, but you must show your work.

You may have a single handwritten 3×5 notecard.

Calculators are not allowed.

Place a box around your FINAL ANSWER to each question where appropriate.

Turn off anything that might go beep during the exam.

Good luck!

1. (12 points)

(a) State the definition of $f'(x)$, the derivative of the function $f(x)$.

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

(b) Find the derivative of $f(x) = 4 - \sqrt{x}$ using the limit definition of the derivative. No credit will be awarded for using other methods.

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{(4 - \sqrt{x+h}) - (4 - \sqrt{x})}{h} \\ &= \lim_{h \rightarrow 0} \frac{\sqrt{x} - \sqrt{x+h}}{h} \cdot \frac{(\sqrt{x} + \sqrt{x+h})}{(\sqrt{x} + \sqrt{x+h})} \\ &= \lim_{h \rightarrow 0} \frac{x - (x+h)}{h(\sqrt{x} + \sqrt{x+h})} = \lim_{h \rightarrow 0} \frac{-h}{h(\sqrt{x} + \sqrt{x+h})} \\ &= \lim_{h \rightarrow 0} \frac{-1}{\sqrt{x} + \sqrt{x+h}} = \frac{-1}{2\sqrt{x}} \end{aligned}$$

2. (20 points) Evaluate the following limits. Show your work to earn full credit. Be careful to use proper notation.

$$(a) \lim_{x \rightarrow 3} \frac{x^2 - 9}{2x^2 - 5x - 3} = \lim_{x \rightarrow 3} \frac{(x-3)(x+3)}{(x-3)(2x+1)} = \lim_{x \rightarrow 3} \frac{x+3}{2x+1} = \frac{3+3}{2 \cdot 3+1} = \frac{6}{7}$$

$\underbrace{\hspace{10em}}_{\text{form } \frac{0}{0}}$

$$(b) \lim_{x \rightarrow c} \frac{\frac{1}{c} - \frac{1}{x}}{x - c} = \lim_{x \rightarrow c} \frac{\frac{x-c}{cx}}{x-c} = \lim_{x \rightarrow c} \frac{1}{cx} = \frac{1}{c^2}$$

$$(c) \lim_{x \rightarrow 4^-} \frac{\sqrt{x}}{x^2 - 2} = \frac{\sqrt{4}}{4^2 - 2} = \frac{2}{16 - 2} = \frac{2}{14} = \frac{1}{7}$$

$$(d) \lim_{x \rightarrow -1^-} \frac{8 - 8x}{1 - x^2} = -\infty$$

\uparrow form $\frac{16}{0}$

As $x \rightarrow -1^-$ (so x -values like -1.001)

$$1 - x^2 \rightarrow 0^- \quad \text{and} \quad 8 - 8x \rightarrow 16$$

So the quotient is $-\infty$.

3. (10 points) Let $f(x) = \begin{cases} \frac{\sqrt{x+5}}{2} & x < 9 \\ 6 & x = 9 \\ 3 + e^{x-9} & 9 < x \end{cases}$

(a) Show that $\lim_{x \rightarrow 9} f(x)$ exists.

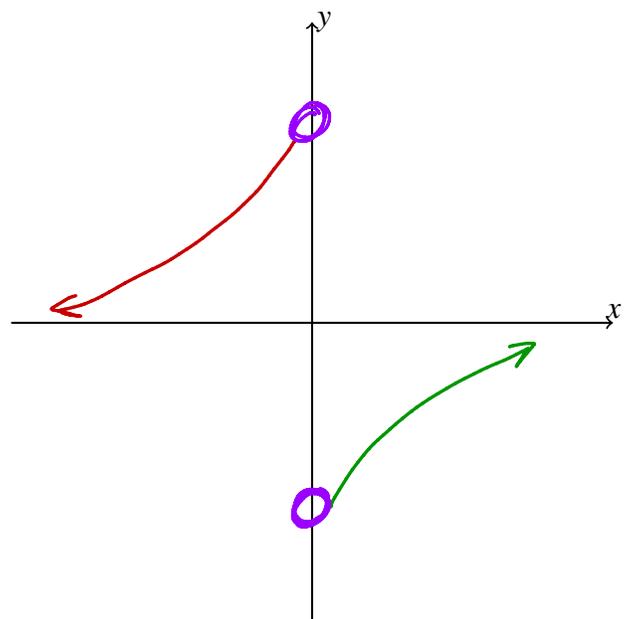

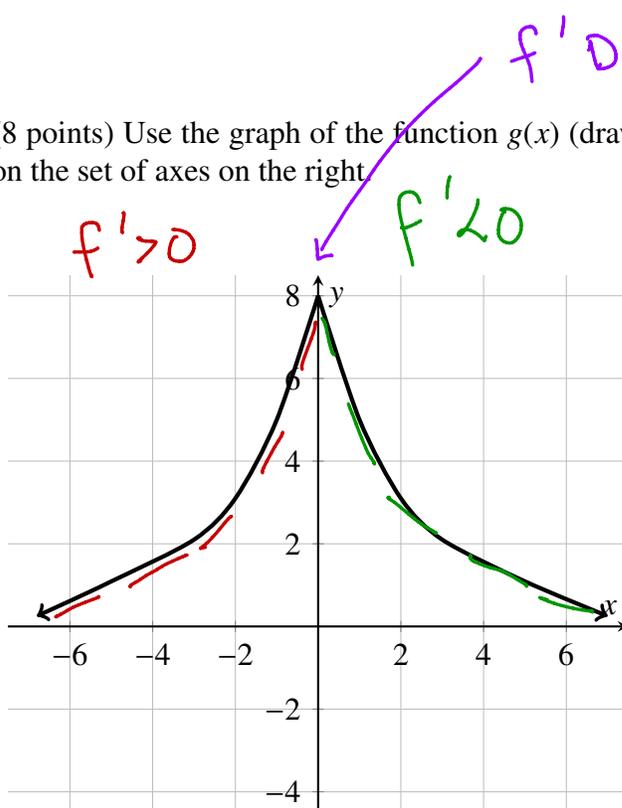

$$\lim_{x \rightarrow 9^-} f(x) = \lim_{x \rightarrow 9^-} \frac{\sqrt{x+5}}{2} = \frac{\sqrt{9+5}}{2} = \frac{3+5}{2} = 4$$

$$\lim_{x \rightarrow 9^+} f(x) = \lim_{x \rightarrow 9^+} 3 + e^{x-9} = 3 + e^0 = 3 + 1 = 4$$

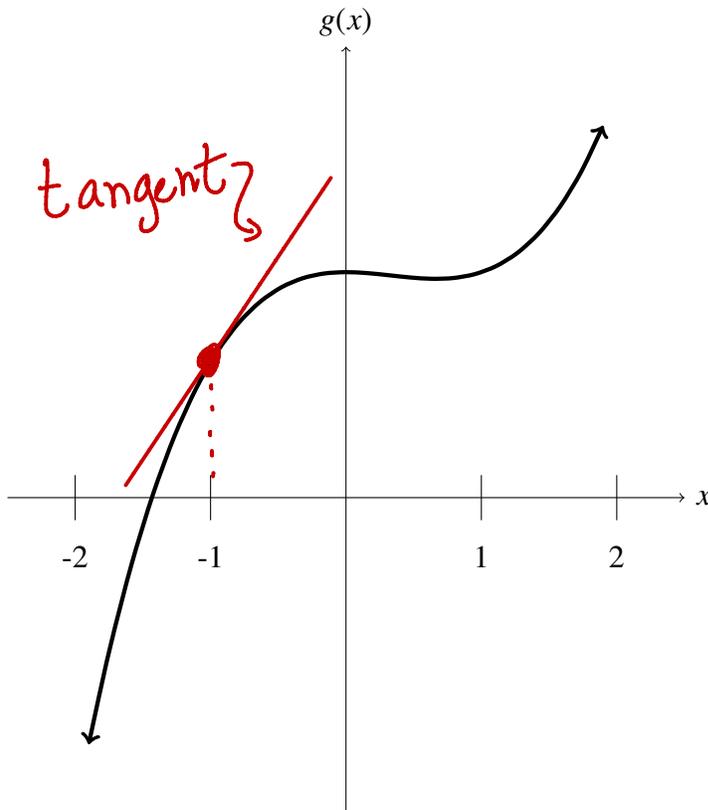

(b) Determine if $f(x)$ is continuous at $x = 9$ and provide a mathematical justification for your conclusion.

Since the left and right side limits exist and are equal, the two-sided limit exists.

4. (8 points) Use the graph of the function $g(x)$ (drawn on the left below) to sketch the graph of $g'(x)$ on the set of axes on the right

5. (12 points) The function $g(x) = x^2(x - 1) + 4$ is graphed below.

$$g(x) = x^3 - x^2 + 4$$

$$g'(x) = 3x^2 - 2x$$

$$g'(-1) = 3(-1)^2 - 2(-1) \\ = 3 + 2 = 5$$

$$g(-1) = (-1)^3 - (-1)^2 + 4 \\ = -1 - 1 + 4 \\ = 2$$

- (a) Sketch and label the **tangent** line to the graph of $g(x)$ when $x = -1$.

- (b) Write an equation of the tangent line to $g(x)$ when $x = -1$.

point $(-1, 2)$ line: $y - 2 = 5(x + 1)$
 slope $m = 5$ $y = 2 + 5(x + 1)$

- (c) Find all x -values where the graph of $g(x)$ has a horizontal tangent or explain why none exist.

Find x -values where $g'(x) = 3x^2 - 2x = 0$

So $x(3x - 2) = 0$.

So $x = 0$ or $x = 2/3$

6. (15 points) Find the derivative of each function below. You do not need to simplify your answer.

$$(a) f(x) = 2x^5 + \frac{2}{x^5} + 2\sqrt{5} = 2x^5 + 2x^{-5} + 2\sqrt{5}$$

$$f'(x) = 10x^4 - 10x^{-6}$$

$$(b) H(\theta) = \theta^{2/3} \sin(\theta)$$

$$H'(\theta) = \frac{2}{3} \theta^{-1/3} \cdot \sin(\theta) + \theta^{2/3} \cos(\theta)$$

$$(c) j(x) = \frac{x}{\pi + \cos(x)}$$

$$j'(x) = \frac{(\pi + \cos(x))(1) - x(-\sin(x))}{(\pi + \cos(x))^2} = \frac{\pi + \cos(x) + x \sin(x)}{(\pi + \cos(x))^2}$$

7. (6 points) The function $V(T)$ models the volume of a fixed mass of gas with respect to temperature where volume V is measured in milliliters (or mL) and temperature T is measured in kelvins (or K).

(a) Interpret in the context of the problem the meaning of $V(100) = 60$. Include units.

At a temperature of 100 kelvins, the volume of the gas is 60 mL.

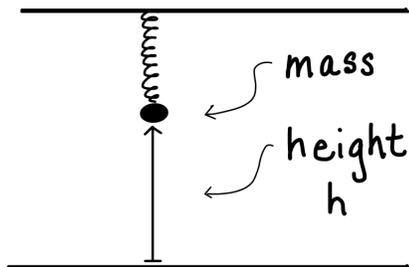

(b) Interpret in the context of the problem the meaning of $V'(100) = 0.4$. Include units.

At a temperature of 100 kelvins, the volume of gas is increasing at a rate of 0.4 mL per kelvin.

(c) Using the facts that $V(100) = 60$ and $V'(100) = 0.4$, estimate $V(110)$. Include units.

$$V(110) = V(100) + 10 \cdot V'(100) = 60 + 10(0.4) = 64 \text{ K.}$$

8. (17 points) A spring is hanging from the ceiling with a mass attached to it. The mass is oscillating vertically with simple harmonic motion. The function $h(t) = 6 - \cos(t)$ models the height of the spring above the floor starting at time $t = 0$ where h is measured in feet and t is measured in seconds. **For all problems below, include appropriate units.**

$$h(t) = 6 - \cos(t)$$

$$h(\pi) = 6 - \cos(\pi) = 7$$

$$h(0) = 6 - \cos(0) = 5$$

- (a) Find the average velocity of the mass in the time interval $[0, \pi]$ seconds.

$$\text{avg vel} = \frac{\Delta h}{\Delta t} = \frac{h(\pi) - h(0)}{\pi - 0} = \frac{7 - 5}{\pi} = \frac{2}{\pi} \text{ ft/s}$$

- (b) Find the equations for the velocity and acceleration of the mass.

$$h'(t) = \sin(t) \text{ ft/s}$$

$$h''(t) = \cos(t) \text{ ft/s}^2$$

- (c) Find the instantaneous velocity of the mass at $\pi/4$ seconds.

$$h'\left(\frac{\pi}{4}\right) = \sin\left(\frac{\pi}{4}\right) = \frac{\sqrt{2}}{2} \text{ ft/s}$$

- (d) At $t = \pi/4$, is the mass going up or going down? Justify your answer.

going up

- (e) Determine all times $t > 0$ at which the mass changes direction?

Check for $v'(t) = 0$.

Solve $\sin(t) = 0$

So $t = 0, \pi, 2\pi, 3\pi, \dots$

Extra Credit: (5 points) Use the Intermediate Value Theorem to demonstrate that the function $f(x) = x^3 - 3x - 19$ has a root (or zero) in the interval $[1, 5]$. A complete answer requires some calculations **and** complete sentences justifying your conclusion.

Since $f(x)$ is a polynomial, it is continuous and the Intermediate Value Theorem applies.

$$\text{Observe that } f(1) = 1^3 - 3(1) - 19 < 0 \text{ and}$$
$$f(5) = 5^3 - 3 \cdot 5 - 19 > 0.$$

Since $f(1) < 0$ and $f(5) > 0$, the Intermediate Value Theorem implies that $f(x) = 0$ for some x -value between 1 and 5.
