

Section 2.1

Secant line means the line between two points on a graph.

tangent line is a line through one point of graph that "matches" the slope of the graph at that point

Crucial Ideas

1. Finding the slope of a line through two points is Easy.
Through one point? Not easy
2. The tangent line can be approximated really well by a secant line.

Example: $f(x) = x^2$

1. Find slope of secant line from $x=1$ to $x=2$.

ans: $f(1) = 1^2 = 1$, $f(2) = 2^2 = 4$; $P = (1, 1)$, $Q = (2, 4)$

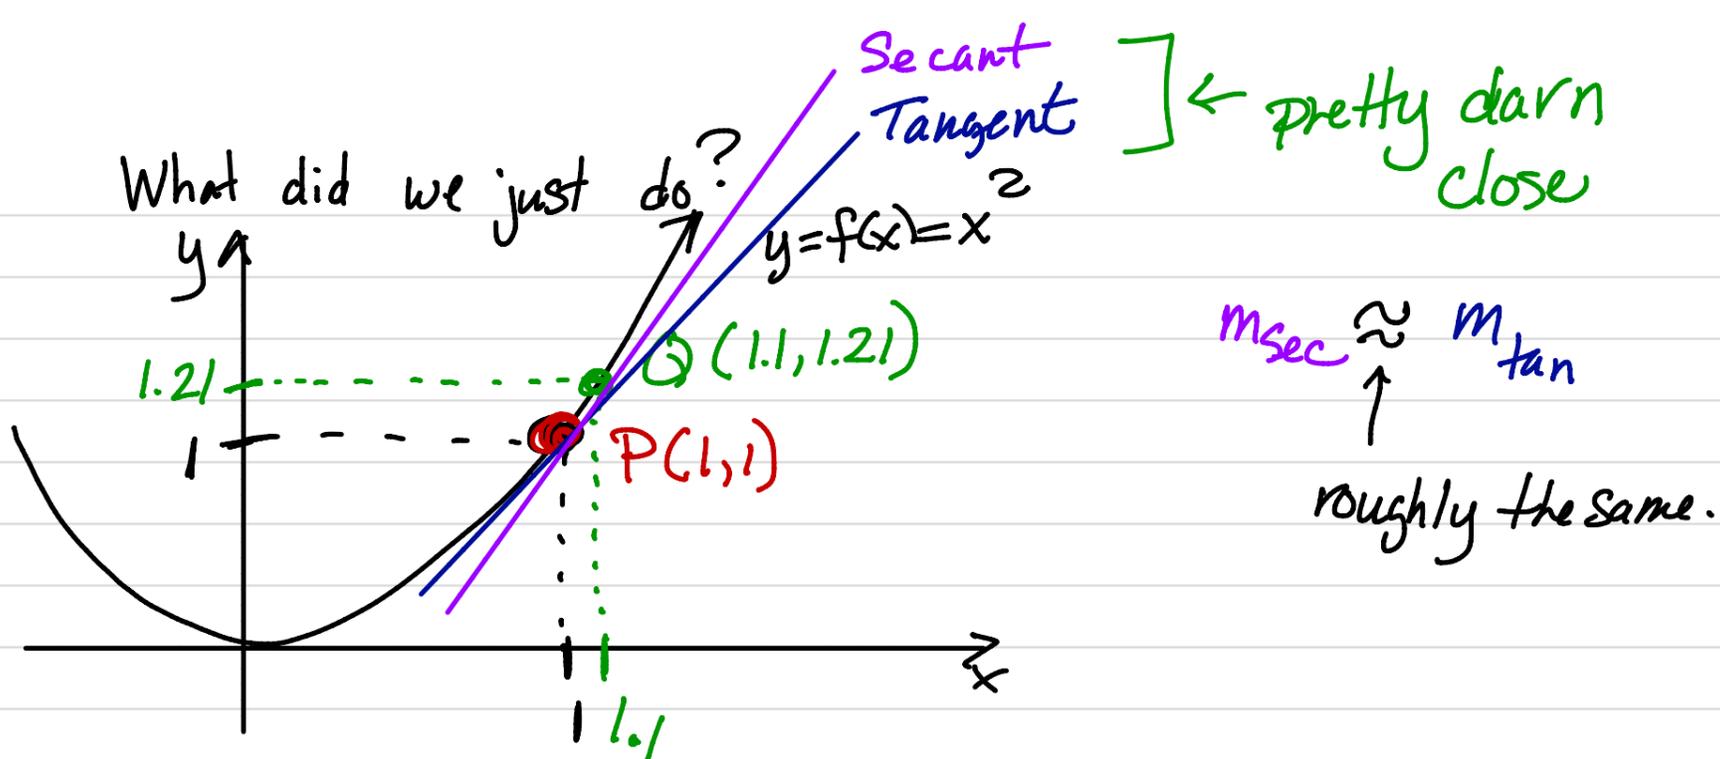

$$m = \frac{4-1}{2-1} = \frac{3}{1} = 3$$

See cartoon 

2. Use a secant line to estimate the slope of tangent line to $f(x)$ at $x=1$.

ans: Since $P(1, 1)$, pick a Q super-duper close... like $x=1.1$. So $y = (1.1)^2 = 1.21$. OR $Q(1.1, 1.21)$

$$\text{Now } m = \frac{1.21-1}{1.1-1} = \frac{0.21}{0.1} = 2.1. \text{ So } m_{\text{tangent}} \approx 2.1$$

- How could we make our estimation better?
- Could someone else correctly answer the question slightly differently?
- Why would one care?

What if $y = f(x)$ was distance travelled (in ft?)
and x was time in (in sec?),
what is m ?

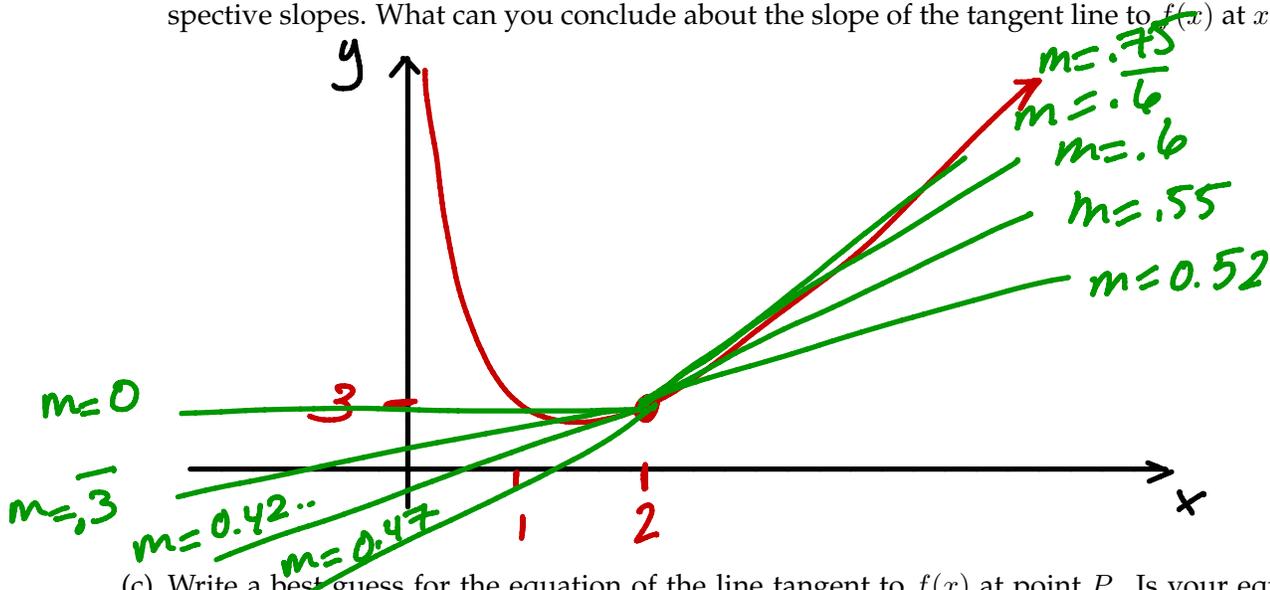

What if $y = \#$ heartbeats
 $x =$ time in seconds, what is m ?

1. The point $P(2, 3)$ lies on the graph of $f(x) = x + \frac{2}{x}$.

- (a) If possible, find the slope of the secant line between the point P and each of the points with x values listed below. For each estimate the slope to 4 decimal places. NOTE: You do not need the graph of the function to answer this numerical question.

| point Q | | slope of secant line PQ |
|------------|------------|---------------------------|
| x -value | y -value | PQ |
| $x = 4$ | 4.5 | 0.7500 |
| $x = 3$ | 3.6 | 0.6 |
| $x = 2.5$ | 3.3 | 0.6000 |
| $x = 2.25$ | 3.1388 | 0.5555... |
| $x = 2.1$ | 3.05238 | 0.52380 |
| $x = 0$ | undefined | ~ |
| $x = 1$ | 3 | 0 |
| $x = 1.5$ | 2.83 | 0.3 |
| $x = 1.75$ | 2.892857 | 0.42857 |
| $x = 1.9$ | 2.95263 | 0.47368 |

- (b) Now, use technology to sketch a rough graph $f(x)$ on the interval $(0, 5]$ and add the secant lines from part a . (Your graph may be messy...It's ok.) Label the secant lines with their respective slopes. What can you conclude about the slope of the tangent line to $f(x)$ at $x = 2$?

- (c) Write a best guess for the equation of the line tangent to $f(x)$ at point P . Is your equation plausible?

guess $m = \frac{1}{2}$. line: $y - 3 = \frac{1}{2}(x - 2)$
 $y = \frac{1}{2}x + 2$

Plausible? Yes. It should be positive (sloped up) and less than one.
