

SECTION 4-3: HOW DERIVATIVES AFFECT THE SHAPE OF A GRAPH, DAY 1

1. Consider $f(x) = \frac{2}{3}x^3 + x^2 - 12x + 7$, and observe $f'(x) = 2x^2 - 2x - 12 = 2(x - 2)(x + 3)$.

(a) What are the critical points of $f(x)$? (Where does $f'(x) = 0$) _____

(b) Fill in the following table, by evaluating $f'(x)$ at "sample points" in the intervals:

x	$x < -3$	-3	$-3 < x < 2$	2	$x > 2$
sample point	-4	-3	0	2	5
sign or value of f'					
Increasing/decreasing: f is ↗ or ↘					

(c) On what interval(s) is $f(x)$ increasing? _____ decreasing? _____

(d) Use the First Derivative Test to determine where f has a local max and local min (if any):

i. Local max at $x = \underline{\hspace{2cm}}$ because f' goes from $\underline{\hspace{1cm}}$ to $\underline{\hspace{1cm}}$.

ii. Local min at $x = \underline{\hspace{2cm}}$ because f' goes from $\underline{\hspace{1cm}}$ to $\underline{\hspace{1cm}}$.

(e) It is a fact that $f''(x) = 4x - 2$, so $f''(x) = 0$ when $x = \underline{\hspace{2cm}}$.

Fill in the expanded chart:

x	$x < -3$	-3	$-3 < x < 1/2$	$1/2$	$1/2 < x < 2$	2	$x > 2$
sample point	-4	-3	0	$1/2$	1	2	5
sign or value of f'							
sign or value of f''							
concavity: f is ↗↘ ↗↘							

(f) Use the Second Derivative Test to determine where f has local maxima or minima:

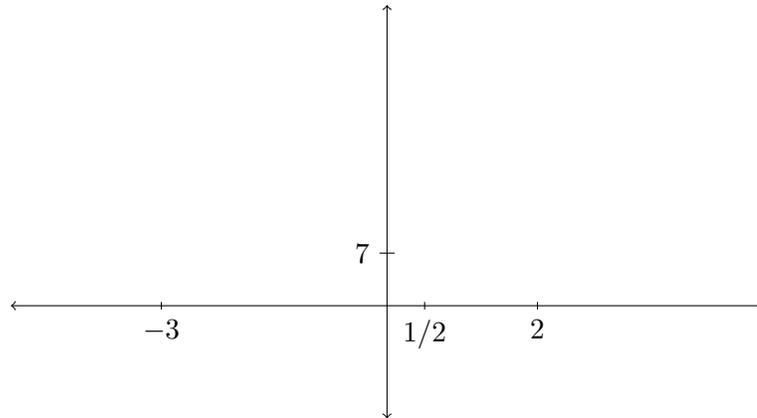

i. Local max at $x = \underline{\hspace{2cm}}$ because $f'(\underline{\hspace{1cm}}) = \underline{\hspace{1cm}}$ and $f''(\underline{\hspace{1cm}}) \underline{\hspace{1cm}}$.

ii. Local min at $x = \underline{\hspace{2cm}}$ because $f'(\underline{\hspace{1cm}}) = \underline{\hspace{1cm}}$ and $f''(\underline{\hspace{1cm}}) \underline{\hspace{1cm}}$.

(g) Where does f have an inflection point? $x = \underline{\hspace{2cm}}$

How do you know? _____

- (h) Use the information you collected to sketch the graph of $f(x)$. You don't have to be accurate with the y -values, but they should be correct relative to each other. Because $f(0) = 7$, you can use that to "nail down" the position of your curve on the graph. Note that

2. Consider $g(x) = xe^x$, and note $g'(x) = xe^x + x = e^x(x + 1)$ and $g''(x) = e^x(x + 2)$.

- (a) What are the critical point(s) of $g(x)$?
- (b) Where is g increasing?
- (c) Use the First Derivative Test to determine whether g has a local max or min at its critical point.
- (d) Use the Second Derivative Test to determine whether g has a local max or min at its critical point.

3. Consider the function $h(x) = x^3$ and observe $h'(x) = 3x^2$ and $h''(x) = 6x$.

(a) What are the critical point(s) of $h(x)$?

(b) What happens when you try to use the Second Derivative Test to determine whether h has a local max or min at its critical point?

(c) Make a table of first and second derivatives to determine where h is increasing, decreasing, concave up, and/or concave down. Then sketch h .

4. Consider the function $j(x) = x^4$ and observe $j'(x) = 4x^3$ and $j''(x) = 12x^2$.

(a) What are the critical point(s) of $j(x)$?

(b) What happens when you try to use the Second Derivative Test to determine whether j has a local max or min at its critical point?

(c) Make a table of first and second derivatives to determine where j is increasing, decreasing, concave up, and/or concave down. Then sketch j .
