

1. Consider the function  $f(x)$  and its derivatives:

$$f(x) = \frac{e^x}{1+x}$$
$$f'(x) = \frac{xe^x}{(1+x)^2}$$
$$f''(x) = \frac{e^x(x^2+1)}{(1+x)^3}.$$

a. Find the critical numbers of  $f(x)$ .

b. Find the open intervals on which the function is increasing or decreasing.

c. Find the open intervals on which the function is concave up or concave down.

**d.** Classify all critical points – using the first derivative test.

**e.** Classify all critical points – using the second derivative test.

**f.** Find the inflection points.

**g.** Sketch the graph.

2. Find the linearization of  $f(x) = \sqrt{x}$  at  $a = 4$  and use it to estimate  $\sqrt{4.1}$ .
3. Show that the point  $(2, 3)$  lies on the curve  $x^2 + xy - y^2 = 1$ . Then find the slope of the tangent line to the curve at that point.

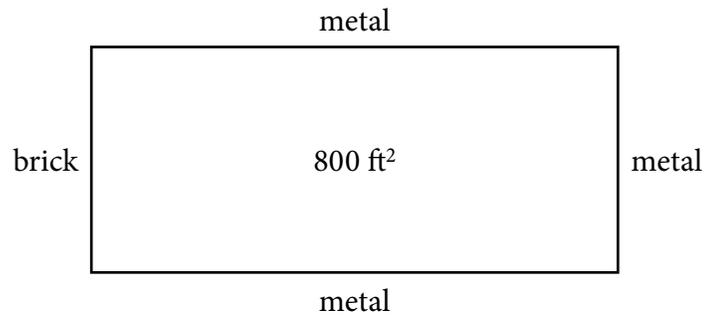

4. A ball of metal is being heated in an oven, and its radius is increasing at a rate of 0.1 cm/min. At what rate is the ball's volume increasing when its radius is 3 cm?

5. Evaluate the following limits.

$$\lim_{x \rightarrow 0} \frac{1 + x - e^x}{\sin x}$$

$$\lim_{x \rightarrow 0^+} (1 + 2x)^{1/x}$$

6. A landscape architect wishes to enclose a rectangular garden on one side by a brick wall costing \$30 per foot and on the other three sides with a metal fence costing \$10 per foot. The area of the garden is to be  $800\text{ft}^2$ . What are the dimensions of the garden that minimize the cost of the fencing?

7.

a. State the Mean Value Theorem and draw a picture to illustrate it.

b. Suppose  $f(x)$  is continuous on  $[-1, 1]$  and has a derivative at each  $x$  in  $(-1, 1)$ . If  $f(-1) = 7$  and  $f(1) = 5$ , what does the Mean Value Theorem let you conclude?
