## Math F252

## Midterm 2

Fall 2025

Name:	

## **Rules:**

You have 90 minutes to complete this midterm.

Partial credit will be awarded, but you must show your work.

Calculators are not allowed.

One hand-written sheet of notes is allowed.

Turn off anything that might go beep during the exam.

Good luck!

v1

- 1. (8 pts) Consider the sequence  $S = \{\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \dots \}$ .
  - (a) (4 pts) Find a formula for the general term  $a_n$  of the sequence assuming that the pattern of the first few terms continues.

$$a_n = \frac{n}{n+1}$$
 for  $n = 1, 2, 3, ...$ 

(b) (2 pts) Does this sequence converge? Justify your conclusion.

Yes 
$$\lim_{n\to\infty} \frac{n}{n+1} = 1$$

(c) (2 pts) Does series  $\sum_{n=1}^{\infty} a_n$ , with terms from the sequence S, converge? Justify your conclusion.

2. (8 pts) Determine if the integral below converges or diverges. Evaluate the integral if it converges. To earn full points, a solution must contain clear complete work and correct use of notation.

$$\int_{0}^{4} \frac{1}{(4-x)^{2/3}} dx = \lim_{t \to 4^{-}} \int_{0}^{t} (4-x)^{3/3} dx = \lim_{t \to 4^{-}} -3(4-x)^{3/3} \Big|_{0}^{t}$$

$$= -3 \lim_{t \to 4^{-}} \left( \sqrt[3]{4-t} - \sqrt[3]{4} \right) = 3\sqrt[3]{4}$$

3. (12 pts) For each **convergent** series below, determine its sum.

(a) 
$$\sum_{n=1}^{\infty} \left( \frac{3}{n^4} - \frac{3}{(n+1)^4} \right) = \left( \frac{2}{1} - \frac{2}{25} \right) + \left( \frac{2}{25} - \frac{2}{35} \right) + \left( \frac{2}{35} - \frac{2}{45} \right) + \dots$$

$$Since S_k = \left( \frac{2}{1} - \frac{2}{25} \right) + \dots + \left( \frac{2}{k^5} - \frac{2}{(k+1)^5} \right)$$

$$= 2 - \frac{2}{(k+1)^5}$$

$$\lim_{k \to \infty} \left( 2 - \frac{2}{(k+1)^5} \right) = 2$$

(b) 
$$\sum_{n=1}^{\infty} \frac{(-5)^{n-1}}{2^{3n}}$$
.  $=\sum_{n=1}^{\infty} \frac{(-5)^{n-1}}{8^n} = \sum_{n=1}^{\infty} \frac{1}{8} \left(\frac{-5}{8}\right)^{n-1}$ 

geometric. 
$$a = \frac{1}{8}$$
,  $r = -\frac{5}{8}$ .

So the sum is 
$$\frac{\frac{1}{8}}{1-(\frac{5}{8})} = \frac{1}{8} \cdot \frac{1}{1+\frac{13}{8}} = \frac{1}{13}$$

4. (8 pts) Use the **Integral Test** to determine if the series  $\sum_{n=1}^{\infty} ne^{-n^2}$  converges or diverges. (You do not have to verify that the Integral Test applies.)

$$\int_{1}^{\infty} x e^{x^{2}} dx = \lim_{t \to \infty} \int_{1}^{t} \frac{-x^{2}}{x e^{x}} dx = \lim_{t \to \infty} \left| \frac{-x^{2}}{2} \right|^{t}$$

$$=\lim_{z\to z} \left[ -\frac{1}{2}e^{z} + \frac{1}{2}e^{z} \right] = \lim_{z\to z} \left( -\frac{1}{2e^{z}} + \frac{1}{2e} \right) = \frac{1}{2e}$$

So the Series converges.

5. (6 pts each) For each series below, show whether the series converges or diverges using an appropriate test. **State the test you use.** 

(a) 
$$\sum_{n=1}^{\infty} \frac{n^6}{2^n}$$
 Converges by the Ratio Test

$$\lim_{n\to\infty} \frac{(n+1)^{\frac{1}{7}}}{2^{n+1}} \cdot \frac{2^n}{n^{\frac{1}{7}}} = \lim_{n\to\infty} \frac{1}{2} \cdot (\frac{n+1}{n}) = \frac{1}{2} < 1$$

So, the Series 
$$\sum_{n=1}^{\infty} \frac{1}{2^n}$$
 converges.

(Root Test also a good choire here)

(b) 
$$\sum_{n=1}^{\infty} \frac{n!}{(n+3)!} = \sum_{n=1}^{\infty} \frac{1}{(n+3)(n+2)(n+1)}$$

Apply L.C.T to  $\sum_{n=1}^{\infty} \frac{1}{n^3}$ , a convergent p-series.

So lim 
$$\frac{n^3}{(n+3)(n+2)(n+1)} = 1$$
.

So the series 
$$\sum_{n=1}^{\infty} \frac{n!}{(n+3)!}$$
 converges.

(Direct) Comparison test would work, too.

(c) 
$$\sum_{n=1}^{\infty} (-1)^{n+1} \ln \left(\frac{1}{n}\right)$$

This diverges by the Divergences Test.

5

(d) 
$$\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{\sqrt[3]{n+2}}$$

(d)  $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{\sqrt[3]{n+2}}$  Converges by the Alternating Series Test.

$$b_n = \frac{1}{\sqrt[3]{n+3}}.$$

$$\begin{array}{cccc}
\hline
\text{1} & & & \\
\hline
\text{1} & &$$

(2) 
$$\sqrt[3]{n+4} > \sqrt[3]{n+3}$$
  
So  $\frac{1}{\sqrt[3]{n+4}} < \frac{1}{\sqrt[3]{n+3}}$   
So book 4 by  $\sqrt{\frac{1}{2}}$ 

6. (8 pts) Determine whether the series  $\sum_{n=1}^{\infty} \frac{(-1)^{n+1} n^3}{5+n^5}$  is absolutely convergent, conditionally convergent, or divergent.

It's absolutely convergent.

It's absolutely convergent.

$$\sum_{n=1}^{\infty} \left| \frac{n^3}{5+n^5} \right| = \sum_{n=1}^{\infty} \frac{n^3}{5+n^5} . \text{ This series}$$

$$\sum_{n=1}^{\infty} \left| \frac{n^3}{5+n^5} \right| = \sum_{n=1}^{\infty} \frac{n^3}{5+n^5} . \text{ This series}$$

$$\sum_{n=1}^{\infty} \left| \frac{1}{n^2} \right|, \text{ a convergent}$$

$$\sum_{n=1}^{\infty} \frac{1}{n^2}, \text{ a convergent}$$

P-Series.

$$\lim_{n\to\infty} \frac{n^3}{5+n^5} \cdot \frac{n^2}{1} = 1.$$

7. (12 pts) Determine the radius of convergence, R, and the interval of convergence for each power

(a) 
$$\sum_{n=0}^{\infty} \frac{(x-2)^n}{5n+4}$$

$$\lim_{n \to \infty} \frac{\left| \frac{(x-2)^n}{5n+4} \right|}{\left| \frac{(x-2)^{n+1}}{5n+4} \right|} = \lim_{n \to \infty} \left| \frac{5n+4}{5n+4} \right| = |x-2| < 1$$

$$n=0$$
  $p$ -surled.  
 $\lim_{n\to\infty} \frac{n}{5n+4} = \frac{1}{5}$   
 $X=1: \sum_{s=0}^{C-1} \frac{C}{5n+4}$ . This converges by  $4S.T.$ 

① lim 
$$\frac{1}{5n+4} = 0$$
 and ②  $\frac{1}{5n+4} = \frac{1}{5n+4} < \frac{1}{5n+4} = \frac{1}{5n+4} < \frac{1}{5n+4} = \frac{1}{5n+4}$ 

(b) 
$$\sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$\lim_{n\to\infty} \left| \frac{x^{n+1}}{(n+1)!} \cdot \frac{n!}{x^n} \right| = \lim_{n\to\infty} |x| \cdot \frac{1}{n+1} = 0 < 1, \text{ always.}$$

- 8. (12 pts)
  - (a) Find a power series representation for the function  $f(x) = \frac{x}{1 6x}$ .

$$f(x) = x \sum_{n=0}^{\infty} (6x)^n = \sum_{n=0}^{\infty} 6^n x^{n+1}$$

(b) Determine the radius of convergence and interval of convergence for the power series in part (a).

$$\lim_{n\to\infty} \left| \frac{6^{n+1} \cdot n+2}{6^n \cdot x^{n+1}} \right| = \lim_{n\to\infty} 6|x| \times 1 \cdot So |x| \times \frac{1}{6}$$

$$R = \frac{1}{6} \cdot 1.0.c \quad (-\frac{1}{6}) \cdot \frac{1}{6}$$
Since  $\sum_{n=0}^{\infty} 1^n \text{ and } \sum_{n=0}^{\infty} -(-1)^n$ 
are both divergent geometric series (w/ |r|= |>1)

(c) Use your answer from part (a) to find a power series representation for f'(x).

$$f'(x) = \sum_{n=0}^{\infty} 6^n (n+1) \times^n$$

9. (8 pts) Find the Taylor series for  $f(x) = \frac{1}{x}$  at a = 3. Your answer should be simplified.

$$f(x) = x^{-1}$$

$$f''(x) = -x^{-2}$$

$$f'''(x) = 1 \cdot 2 \cdot x^{-3}$$

$$f'''(x) = -1 \cdot 2 \cdot 3x^{-4}$$

$$f(x) = -1 \cdot 3x^{-4}$$

$$f(x) = -1 \cdot 3x^{-4}$$

$$f(x) = -1 \cdot$$

Extra Credit (5 pts) Determine the convergence of the two series below.

a. 
$$\sum_{n=1}^{\infty} (\sqrt[n]{2} - 1)^n$$
 Converges by the noot test. 
$$\lim_{n \to \infty} \sqrt[n]{(\sqrt[n]{2} - 1)^n} = \lim_{n \to \infty} \sqrt[n]{2} - 1 = 1 - 1 = 0 < 1$$

b. 
$$\sum_{n=1}^{\infty} (\sqrt[n]{2} - 1)$$

Diverges by L.C.T. to 
$$\sum_{n=1}^{\infty} \frac{1}{n}$$
, divergent   
Provies

$$\lim_{n\to\infty} \frac{\sqrt{2}-1}{\frac{1}{n}} = \lim_{n\to\infty} \frac{2^{\frac{1}{n}}-1}{\frac{1}{n}} = \lim_{n\to\infty} \frac{\ln(2) \cdot 2^{\frac{1}{n}} \cdot \ln(2) \cdot 2^{\frac{1}{n}}}{\ln(-1) \cdot n^{\frac{1}{n}}} = \lim_{n\to\infty} \ln(2) \cdot 2^{\frac{1}{n}}$$

Therefore by L.C.T. to  $\sum_{n=1}^{\infty} \frac{1}{n}$ , divergent  $\sum_{n$
