Cryptography (Day 3)

1. **Progressive Caesar Cipher**: Start with a Caesar cipher, and then shift one letter with each character you are encrypting.

	A	**B**	**C**	**D**	**E**	**F**	**G**	**H**	**I**	**J**	**K**	**L**	**M**	**N**	**O**	**P**	**Q**	**R**	**S**	**T**	**U**	**V**	**W**	**X**	**Y**	**Z**
Q	Q	R	S	T	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
R	R	S	T	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q
S	S	T	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R
T	T	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S
U	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T

(a) Example: Begin with the shift cipher $A \to Q$, and encrypt the word H E L L O

(b) Example: Suppose the ciphertext was encrypted with the above scheme. Decrypt the word F R J M S.

2. **Vigenère Cipher** Choose a keyword, and use that keyword to determine a shift cipher for each letter. (Repeat the keyword over and over.)

	A	**B**	**C**	**D**	**E**	**F**	**G**	**H**	**I**	**J**	**K**	**L**	**M**	**N**	**O**	**P**	**Q**	**R**	**S**	**T**	**U**	**V**	**W**	**X**	**Y**	**Z**
D	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z	A	B	C
O	O	P	Q	R	S	T	U	V	W	X	Y	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N
G	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z	A	B	C	D	E	F

(a) Example: use the keyword `DOG` and encrypt the phrase WHERESMYFOOD.

(b) Example: Suppose the keyword is `DOG`. Decrypt the ciphertext L Z O N S Y Q C C.

3. **Double Transposition Cipher:** Use two keywords (often of different lengths). Do a transposition cipher with the first keyword to produce a first ciphertext. If there are spaces, ignore them. Then encrypt that ciphertext (as though it were plaintext) using the second keyword.

   Encryption:

   i. Write the plaintext in rows.

   ii. Permute the columns using the keyword.

   iii. Read off the **columns** to form the new "plaintext"

   iv. Write it in rows in the second grid.

   v. Permute the columns using the second keyword.

   vi. Read off the columns to form the final ciphertext.

   Decryption:

   i. Count the number of characters. Determine how many "extra" characters there will be for the second keyword.

   ii. Write your second grid with the permuted keyword.

   iii. Fill in the columns of the grid, making sure to put the extra characters in the appropriate columns. For example, if your second keyword is `SHORT` and you have two "extra" characters, then columns S and H get one more letter than the other columns.

   iv. (Un)permute the columns

   v. Read off the **rows**.

   vi. Using the number of characters, determine the number of "extra" characters for the first keyword.

   vii. Fill in the columns of the grid, filling in the extra long columns using the sorted keyword. For example, if your first keyword is `KEY` and you have two "extra" characters, then columns K and E get one more letter than the other columns.

   viii. Unpermute the columns.

   ix. Read off the **rows**

(a) Example: Encrypt the word TRANSPOSITION using the first key `KEY` and the second key `SHORT`.

(b) Decrypt the ciphertext E T E T S P I H X C R assuming it was encrypted using the scheme above.
